CLAIMS

1. A quartz piece which has a base and at least two times extending from the base, wherein

a groove is formed on at least one of the front surface and the rear surface of the time along the lengthwise direction of the time, and

a gap from at least one side surface of the tine to the groove is gradually increased toward the base.

- 2. The quartz piece according to claim 1, wherein the width of the tine is fixed through the whole length of the tine, while the width of the groove is gradually reduced toward the base.
- 3. The quartz piece according to claim 1, wherein the width of the groove is fixed through the whole length of the groove, while the width of the time is gradually increased toward the base.
- 4. An oscillator which has a base and at least two times extending from the base, in which a groove is formed on at least one of the front surface and the rear surface of the time along the lengthwise direction of the time, a groove electrode is formed in the groove, and a side surface electrode is formed on a side surface of the time,

wherein the width of the tine is fixed through the whole length of the tine, while the width of the groove is gradually reduced toward the base, so that an arrangement area of a connecting electrode is formed.

- 5. The oscillator according to claim 4, wherein the width of the groove is linearly reduced.
- 6. An oscillator which has a base and at least two times extending from the base, in which a groove is formed on at least one of the front surface and the rear surface of the time along the lengthwise direction of the time, a groove electrode is formed in the groove, and a side surface electrode is formed on a side surface of the time,

wherein the width of the groove is fixed through the whole length of the groove, while the width of the tine is gradually increased toward the base.

- 7. The oscillator according to claim 6, wherein the width of the time is linearly increased.
- 8. The oscillator according to claim 4 or 6, wherein the time and the groove formed in the time are formed symmetric with respect to the center line of the time.
- 9. The oscillator according to claim 4 or 6, wherein the oscillator is formed with a tuning fork type crystal oscillating piece.
- 10. An oscillator which has a base and at least two times extended from the base, in which a groove is formed on at least one of the front surface and the rear surface of the time along the lengthwise direction of the time, a groove electrode is formed in the groove, and a side surface electrode is formed on a side surface of the time,

wherein the width of the time is fixed through the whole length of the time, while the width of the groove is gradually

reduced toward the base, so that an arrangement area of a connecting electrode is formed,

the width of the groove is linearly reduced,

the time and the groove are formed symmetric with respect to the center line of the time, and

the oscillator is formed with a tuning fork type crystal oscillating piece.
